

**METHOD AND APPARATUS FOR AUTHENTICATING A USER
AT AN ACCESS TERMINAL**

Abstract of the Disclosure

5 Secure access to a network resource running on a computer or server, is
provided by a method that compares the current physical location of a network
access terminal through which a user is attempting to access the network
resource, and the current physical location of a mobile terminal on the person of
the user who is authorized to access the network resource. If the locations
10 different, then access is denied.
